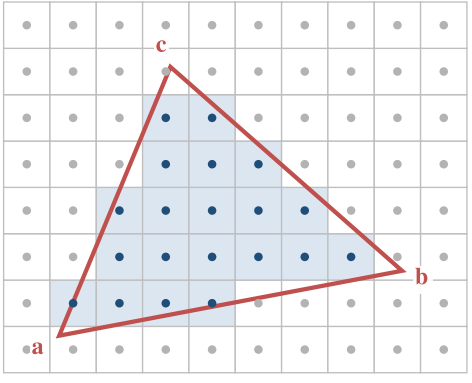
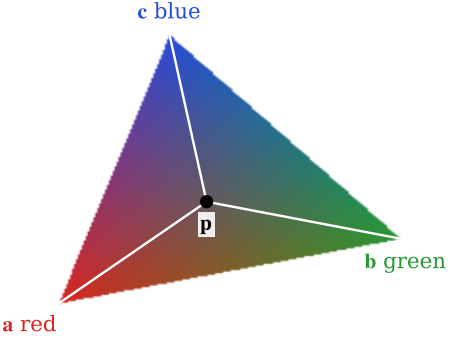
edge functions: which pixels are covered



pixel centre **p** is inside iff E_{ab}, E_{bc}, E_{ca} have the same sign

$$E_{ab}(\mathbf{p}) = (\mathbf{p} - \mathbf{a}) \times (\mathbf{b} - \mathbf{a})$$

barycentric weights: colour interpolation



$\lambda_a, \lambda_b, \lambda_c$ = areas opposite each vertex / total = 0.37, 0.34, 0.30

$$\text{colour}(\mathbf{p}) = \lambda_a \mathbf{c}_a + \lambda_b \mathbf{c}_b + \lambda_c \mathbf{c}_c$$ (same weights for z, **N**, uv)
